Assignment 3: awk

CS3423 - Systems Programming — Sam Silvestro - UTSA

Part A

For this part of the assignment, you will create a **single command** which will take the contents of a passwd file (usually found in `/etc/passwd`) and print it in sorted order by the user's last name (that is, their surname, not their username). Normally, you could solve this with the following options on `sort`: `$ sort -t: -k6 /path/to/passwd`

You, however, must solve this problem with the utilities covered in class so far. You may (and should) use `sort`, but you may not use any of its options (e.g., -k, -t, etc).

Example

Input:

```
lkj293:x:1539:1543:Albert Einstein:/home/einstein:/bin/bash
kkr590:x:1540:1544:Elvis Presley:/home/presley:/bin/bash
nwk409:x:1541:1545:George Washington:/home/washington:/bin/bash
yaa265:x:1542:1546:Bruce Banner:/home/banner:/bin/bash
yhn211:x:1543:1547:George Harrison:/home/harrison:/bin/bash
lfa806:x:1544:1548:Jane Austen:/home/austen:/bin/bash
ilo709:x:1545:1549:Walt Disney:/home/disney:/bin/bash
rfd576:x:1546:1550:Buzz Aldrin:/home/aldrin:/bin/bash
lko889:x:1547:1551:Marie Curie:/home/curie:/bin/bash
cfq219:x:1548:1552:J.R.R. Tolkien:/home/tolkien:/bin/bash
ncz856:x:1549:1553:Christopher Columbus:/home/columbus:/bin/bash
pql747:x:1550:1554:Julius Caesar:/home/caesar:/bin/bash
```

Output:

```
rfd576:x:1546:1550:Buzz Aldrin:/home/aldrin:/bin/bash
lfa806:x:1544:1548:Jane Austen:/home/austen:/bin/bash
yaa265:x:1542:1546:Bruce Banner:/home/banner:/bin/bash
pql747:x:1550:1554:Julius Caesar:/home/caesar:/bin/bash
ncz856:x:1549:1553:Christopher Columbus:/home/columbus:/bin/bash
lko889:x:1547:1551:Marie Curie:/home/curie:/bin/bash
ilo709:x:1545:1549:Walt Disney:/home/disney:/bin/bash
lkj293:x:1539:1543:Albert Einstein:/home/einstein:/bin/bash
yhn211:x:1543:1547:George Harrison:/home/harrison:/bin/bash
kkr590:x:1540:1544:Elvis Presley:/home/presley:/bin/bash
cfq219:x:1548:1552:J.R.R. Tolkien:/home/tolkien:/bin/bash
nwk409:x:1541:1545:George Washington:/home/washington:/bin/bash
```

Script Execution (Part A)

Since the fox machines do not have useful `/etc/passwd` files (no first and last names), you will use the one provided with this assignment. Your submission will include a bash file (`assign3A.sh`) with *exactly one line* in it (you do not need a shebang) and should take the path to the passwd file as the first argument. Do not include an awk file or any other files besides `assign3A.sh`.

```
$ assign3A.sh /path/to/passwd
```

Part B

For this part of the assignment, you will only use the utilities covered in class so far (primarily awk) to create a program for printing user process information. Do not use Python or any programs/utilities not covered in class.

Your program should take the output from `ps -ef` and print the following for each user **having a username matching the abc123 format**:

- Username
- List of commands

After listing statistics for each user, the program should print the following information for all users having a username matching the abc123 format:

- Line with earliest start time
- Line with latest start time

Do not use sed, Python, or any other languages/utilities not covered in class.

Example

The example below is an excerpt from the `ps -ef` command which your program should be able to take as input. Note that if a process began execution on a previous calendar day, its `STIME` value will not be in the usual "hours and minutes" format, but rather in "month and day" format. This should be accounted for properly, and thus a simple text/numerical comparison will not suffice.

Input:

```
UID          PID  PPID  C STIME TTY          TIME CMD
adz110      5344  5334  0 08:47 pts/2    00:00:00 bash
dmq292      6908  6854  0 Jun04 pts/1    00:00:00 bash
adz110      7227  7150  0 Jul11 pts/9    00:00:00 who
erg474      7466  7461  0 08:54 pts/10   00:00:00 ls
dmq292      7966  7960  0 Jun04 pts/13   00:00:00 assign1.sh if of
xle135      8983  8636  0 08:59 pts/15   00:00:00 ssh ctf.cs.utsarr.net
zeh458      9057  1980  0 08:59 pts/7    00:00:00 vim prog.c
rslavin     9150  9139  0 08:59 pts/16   00:00:00 ps -af
xle135      8636  8628  0 08:58 pts/15   00:00:00 bash
```

Output:

```
User: adz110
           bash
           who
User: dmq292
           bash
           assign1.sh if of
User: erg474
           ls
User: xle135
           bash
           ssh ctf.cs.utsarr.net
User: zeh458
           vim prog.c

Earliest Start Time :
dmq292    6908  6854  0 Jun04 pts/1    00:00:00 bash

Latest Start Time :
xle135    8983  8636  0 08:59 pts/15   00:00:00 ssh ctf.cs.utsarr.net
```

Also, if there is a tie for earliest or latest start times, take the one with the UID that comes first alphabetically.

Hint: Consider using `sort` to help with grouping.

Script Execution (Part B)

Your program should each be invoked through a single bash file (see below) with input taken from stdin. The resulting output should be printed directly to stdout.

`$ assign3B.sh < ps.in`

or

```
$ ps -ef | assign3B.sh
```

Assignment Data

Sample input files can be found in:
`/usr/local/courses/ssilvestro/cs3423/Fall19/assign3`.

Script Files

Your submission should consist of multiple files:

- **`assign3A.sh`** - a bash script with a single line of code (i.e., one command) for part A
- **`assign3B.sh`** - a bash script to invoke for part B.
- **`assign3B.awk`** - the awk program used in **`assign3B.awk`**

Verifying Your Programs

Part A can be tested with the sample input provided with **`passwd.in`**.

Part B can be tested with the sample input provided with **`ps.in`**. Your program should also work with arbitrary input from the **`ps -ef`** command.

Submission

Turn your assignment in via Blackboard. Your zip file, named **`abc123.zip`** with your personal abc123 should contain only your bash and awk files.
